
all strains, wk1
top 10% within clusters, wk1
R^2: 0.02, p = 4.3e-02
R^2: 0.62, p = 3.5e-09
ΔCLR
immune coverage, $\frac{\langle Teff \rangle_\Sigma}{\langle Treg \rangle_\Sigma}$
strains ≥ ε × cluster max
slope: $\Delta CLR_{2,1} = m \log_{10}\left(\frac{[effector]}{[Treg]}\right) + b$
R^2:
within-cluster cut-off, ε
strains ≥ cut-off
slope, m
R^2
relative abundance cut-off
