
all strains, wk1
R^2: 0.00, p = 3.4e-01
$\log_{10}(FC_{2,1})$
$\frac{[effector]}{[Treg]}$

top 20% within clusters, wk1
R^2: 0.56, p = 6.9e-11
$\log_{10}(FC_{2,1})$
$\frac{[effector]}{[Treg]}$

strains ≥ ε × cluster max
slope:
$\log_{10}(FC_{2,1}) = m\log_{10}\left(\frac{[effector]}{[Treg]}\right) + b$
within-cluster cut-off parameter, ε

strains ≥ ε × cluster max
R^2:
$\log_{10}(FC_{2,1}) = m\log_{10}\left(\frac{[effector]}{[Treg]}\right) + b$
within-cluster cut-off parameter, ε

strains ≥ cut-off
slope:
$\log_{10}(FC_{2,1}) = m\log_{10}\left(\frac{[effector]}{[Treg]}\right) + b$
relative abundance cut-off

strains ≥ cut-off
R^2:
$\log_{10}(FC_{2,1}) = m\log_{10}\left(\frac{[effector]}{[Treg]}\right) + b$
relative abundance cut-off
